## 1. **Scope**

### 1.1 Identification

This document is the User Manual for the Fibre Channel (FC) Enhanced Network Driver (END) VxWorks Software Driver.

### 1.2 Introduction

The FC END VxWorks Software Driver was developed to support the Intel X86 PC, MVME5100 PPC and the SVME179 PPC platforms. As such the drivers binaries are provided with explicit installation instructions. The FC END VxWorks Software Driver conforms to VxWorks 5.4 END driver model and the driver will interface to VxWorks using this standard.

The FC Adapter is a dual channel PCI Mezzanine Card to FC protocol controller, attaching computers to 1 Gbit/s FC networks using copper cable and 2 Gbit/s using fibre optic cable.

At present, C2I<sup>2</sup> Systems FC Adapters are available in PMC formfactor.

The driver software distribution consists of the following files :

ccfcEndxxx.a <sup>1</sup>	FC END VxWorks Software Driver object file
ccFddiShim.o	Shim module for FDDI compatibility
ccFddiShim.c	Shim source file
ccMib.h	Header file for FDDI END VxWorks Software Driver SMT 7.3 MIB
Readme.txt	Installation notes
Release.txt	Release notes and revision history. Please check this file for information on the latest updates.

---

<sup>1</sup> xxx=X86 for Intel X86 PC, DY4PPC for DY4179/181/182 or 5100 for MV5100 PPC

2. **Applicable and Reference Documents**

2.1 Applicable Documents

2.1.1 RFC2625, *IP and ARP over Fibre Channel* - <http://www.ietf.org/rfc/rfc2625.txt>, dated June 1999.

2.1.2 DI-IPSC-81443, *Data Item Description for a Software User Manual*, dated Apr 89.

2.1.3 VxWorks 5.5, *Programmer's Guide*, dated 2002-07-23.

2.1.4 VxWorks 5.5, *Network Programmer's Guide*, dated 2002-08-14.

2.2 Reference Documents

None.

### 3. Getting Started

This section is a quick start guide for getting the FC END VxWorks Software Driver up and running.

#### 3.1 Loading the Driver

1. Boot VxWorks and load the ccfcEndxxx.a<sup>1</sup> lib with 'ld < ccfcEndxxx.a'.
2. Type 'muxDevStart ( muxDevLoad (unitno, ccfcLoad, "", 0, 0 ))' to attach and start the FC END VxWorks Software Driver. Verify by using muxShow. The *unitno* must be 0 for Function[0] and 1 for Function[1] on the multi-function FC Adapter.
3. Attach the FC END VxWorks Software Driver to the TCP/IP protocol stack. Type 'ipAttach unitno, "ccfc"' and use muxShow and ifShow to confirm that the *ccfcunitno* exists and was attached to TCP/IP.
4. Set the IP address using 'ifAddrSet'. Refer to the VxWorks Network Programmers Guide paragraph '4.4 Overview of TCP/IP' for setting up IP host names and IP routing.
5. Confirm the FC LAN connection using ping. An example is shown below.

Note : This example assumes there is already a Network Interface Card (NIC) on the FC LAN which has been set up with an IP address of 10.0.0.1.

```
-> muxDevStart ( muxDevLoad ( 0,ccfcLoad, "", 0, 0 ))
-> ipAttach 0 , "ccfc"

-> ifShow
ppp (unit number 0):
  Flags: (0x71) UP POINT-TO-POINT ARP RUNNING
  Internet address: 172.16.0.2
  Destination Internet address: 172.16.0.1
  Netmask 0xffff0000 Subnetmask 0xffff0000
  Metric is 0
  Maximum Transfer Unit size is 1 500
  5 packets received; 5 packets sent
  0 input errors; 0 output errors
  0 collisions
lo (unit number 0):
  Flags: (0x69) UP LOOPBACK ARP RUNNING
  Internet address: 127.0.0.1
  Netmask 0xffffffff Subnetmask 0xffffffff
  Metric is 0
  Maximum Transfer Unit size is 4 096
  0 packets received; 0 packets sent
  0 input errors; 0 output errors
  0 collisions
ccfc (unit number 0):
  Flags: (0x63) UP BROADCAST ARP RUNNING
  Netmask 0xffffffff Subnetmask 0xffffffff
  Ethernet address is 00:50:C2:18:D0:00
  Metric is 0
  Maximum Transfer Unit size is 16 384
  18 packets received; 0 packets sent
  0 input errors; 0 output errors
  0 collisions
-> ifAddrSet "ccfc0","10.0.0.4"
```

---

<sup>1</sup> xxx=X86 for Intel X86 PC, DY4PPC for DY4179/181/182 or 5100 for MV5100 PPC

P:\Fibrechn\TECHMAN\CFCMAN01.WPD		Page 3 of 12

```

-> ping "10.0.0.1"
PING 10.0.0.1: 56 Data Bytes
64 Bytes from 10.0.0.1: icmp_seq=1. time=0. ms
64 Bytes from 10.0.0.1: icmp_seq=2. time=0. ms
64 Bytes from 10.0.0.1: icmp_seq=3. time=0. ms

```

### 3.2

#### Loading the FDDI Shim Module

In some instances, the FC Adapter will be used to replace the FDDI Adapter in an existing system. In this case, there is no need to change the user applications. The only difference between the implementation of the FC and FDDI END VxWorks Software Drivers are that the `fddiGetStats()` routine is replaced by the `ccfcGetStats()` routine. The shim is present to restore the difference. Figure 1 below shows a graphical layout of the difference between the two drivers. Users of the FDDI END VxWorks Software Driver will be familiar with the structure `cc_fddi_mib_type` and the following routines :

- `void ccfdiGetStats(struct cc_fddi_mib_type *data)`
- `void ccfdiClrStats(void)`

Although the FC END VxWorks Software Driver is not compatible with the FDDI MIB, calls to the MIB routines will not result in an error as long as the FDDI shim module is loaded. In the FDDI structure `cc_fddi_mib_type`, some fields may or may not correspond with fields in structures of the FC END VxWorks Software Driver . As per default, all the fields will be set to NULL. If any fields in the FDDI MIB needs to be changed to ensure compatibility with a application, the values can be changed in the `ccFddiShim.c` source file and recompiled. A comparative layout of the difference between the drivers are shown below.

Load the FDDI shim with '`ld < ccFddiShim.o`'.

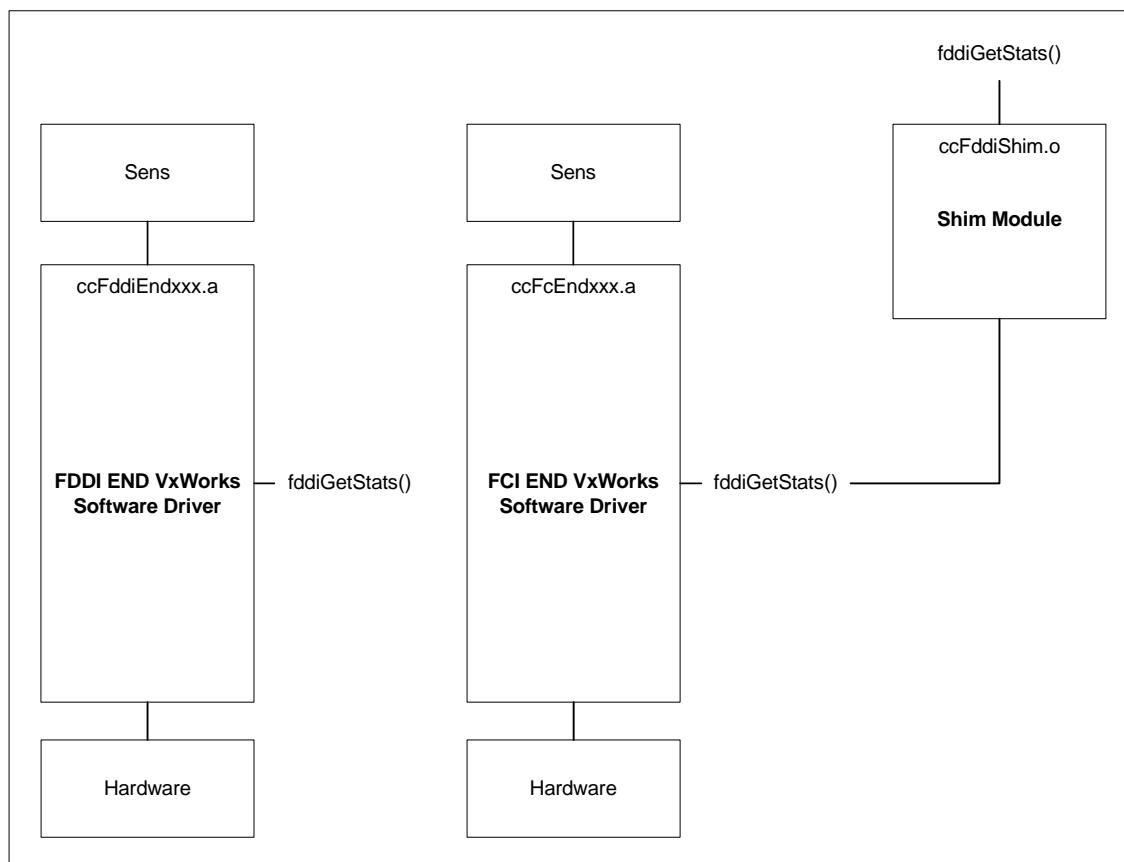

Figure 1 : Comparative Layout of the FDDI and FC END VxWorks Software Drivers

P:\Fibrechn\TECHMAN\FCFCMAN01.WPD		Page 4 of 12

## 4. Installation Procedure

### 4.1 Building the FC END VxWorks Software Driver into the VxWorks Kernel

This section describes the installation instructions for building the FC END VxWorks Software Driver into the VxWorks kernel.

1. Copy ccfcEndxxx.a<sup>1</sup> to your BSP library directory (eg /tornado/target/config/X86/lib).
2. Edit the Makefile in the BSP directory (eg /tornado/target/config/X86).

Find the line

```
MACH_EXTRA =
```

and replace with

```
MACH_EXTRA = ./lib/ccfcEndxxx.a1 ./lib/ccfcShim.o2
```

3. Add the following code fragment to config.h.

(before "#define DEFAULT\_BOOT\_LINE") :

```
/*Added by CCII for FC driver*/
#define INCLUDE_CCFC_END /* CCII FC END DRIVER */

/* CCII Modification */
#ifndef INCLUDE_CCFC_END
#ifndef INCLUDE_PCI
#define INCLUDE_PCI
#endif

#ifndef INCLUDE_BSD
#define INCLUDE_BSD
#endif

#ifndef INCLUDE_END
#define INCLUDE_END
#endif
#endif
#endif

/*End CCII Modification */
```

4. In config.h, change the DEFAULT\_BOOT\_LINE to use the ccfc driver.
5. Add the following to configNet.h.

(Before the start of the endDevTbl[] declaration.)

```
IMPORT END_OBJ * ccfcLoad (char *initString);
```

(Add the following segment to the endDevTbl[] , before the default last entry.)

```
#ifdef INCLUDE_CCFC_END
{ 0, ccfcLoad, "", NULL, NULL, FALSE},
#endif /* INCLUDE_CCFC_END */
```

6. Rebuild all VxWorks images.

---

<sup>1</sup> xxx=X86 for Intel X86 PC, DY4PPC for DY4179/181/182 or 5100 for MV5100 PPC

<sup>2</sup> Refer to Section 3.2

P:\Fibrechn\TECHMAN\CFCMAN01.WPD		Page 5 of 12

## 4.2 Loading the Driver Separately

From the VxWorks shell type :

```
ld < ccfcEndxxx.a1
```

## 4.3 Starting the Driver

The driver is started and attached to the MUX with the VxWorks muxDevLoad and muxDevStart commands. The syntax is as follows :

```
muxDevStart ( muxDevLoad ( unitno, ccfcLoad, "", 0, 0 ) )
```

where unitno corresponds to Function[0] = 0 and Function[1] = 1. This is only necessary if the driver was not included in the configNet.h file as described in Section 4.1.

Type muxShow to see if the driver was installed.

### 4.3.1 Command Line Passing of FC Settings

The FC END VxWorks Software Driver supports the changing of some default parameters at startup.

```
e.g. muxDevStart ( muxDevLoad ( unitno, ccfcLoad, "unitno:NumberOfClusters:MTU" , 0 , 0 ) )
```

where :

- unitno : corresponds to Function[0] = 0 and Function[1] = 1
- NumberOfClusters : Number of TX and RX clusters or buckets - default 227 clusters (RX = 100 and TX = 127 clusters), minimum 10 clusters and maximum 254 clusters.
- MTU : Max Transfer Unit size in Decimal Bytes - default 32 kBytes - 4 Bytes, minimum 1 kByte and maximum 64 kBytes.

If a parameter is not used a placeholder of 0 **must** be used. This is only applicable for NumberOfClusters and MTU.

e.g. To change only NumberOfClusters to 200 :

```
muxDevStart ( muxDevLoad ( 0,ccfcLoad, "0:200:0" , 0 , 0 ) )
```

All parameters preceding the ones you want to change must be specified.

To keep all settings at default values use :

```
muxDevStart ( muxDevLoad ( unitno, ccfcLoad, "", 0, 0 ) )
```

## 4.4 Attaching Driver to TCP/IP stack

Attach the Fibre Channel protocol to the TCP/IP protocol stack with :

```
ipAttach unitno, "ccfc"
```

Use muxShow and ifShow to confirm.

---

## Annexure A

### FDDI vs FC

FDDI	FC
ccFddiEndxxx.a	ccfcEndxxx.a
fddiLoad	ccfcLoad
-	ccfcShim.a
<i>ccfddiGetStats(struct cc_fddi_mib_type *data)</i> - returns FDDI Management Information Base (MIB)	<i>ccfddiGetStats(struct cc_fddi_mib_type *data)</i> - returns a structure with fields set to NULL
<i>ccfddiClrStats(void)</i> - reset counters in the FDDI MIB	<i>ccfddiClrStats(void)</i> - reset some fields related to FC
<i>struct cc_fddi_mib_type</i> - all fields related to FDDI MIB	<i>struct cc_fddi_mib_type</i> - all fields set to NULL except :  rx_packets;0 tx_packets; rx_errors; tx_errors;

### Load the FDDI Shim

In some instances, the FC Adapter will be used to replace the FDDI Adapter in an existing system. In this case, there is no need to change the user applications. The only difference between the FC and FDDI END VxWorks Software Drivers are that the `fddiGetStats()` routine is replaced by the `ccfcGetStats()` routine. The shim is present to restore the difference. Figure 1 shows a graphical layout of the difference between the FDDI END VxWorks Software Driver and the FC END VxWorks Software Driver. Users of the FDDI END VxWorks Software Driver will be familiar with the structure `cc_fddi_mib_type` and the following routines :

- `void ccfddiGetStats`  
(`struct cc_fddi_mib_type *data`)
- `void ccfddiClrStats(void)`

Although the FC END VxWorks Software Driver is not compatible with the FDDI MIB, calls to the MIB routines will not result in an error as long as the FDDI shim module is loaded. In the FDDI structure `cc_fddi_mib_type`, some fields may or may not correspond with fields in structures of the FC END VxWorks Software Driver. As per default, all the fields will be set to NULL.

Load the FDDI shim with '`ld < ccFddiShim.o`'.
